The present invention relates to a new polynucleotide having small inducible cytokine subfamily B (Cys-X-Cys), Member 6 (granulocyte chemicatic protein 2) (SCYB6) isogene. The invention is useful for studying expression and function of SCYB6 and expressing SCYB6 protein for use in screening for candidate drugs to treat diseases related to SCYBG activity. The polymorphism and haplotype data is useful for validating whether SCYB6 is a suitable target for drugs to inflammatory disorders and cancer, screening for such drugs and reducing bias in clinical trials of such drugs. The invention is also useful for the appendic purposes. The method of the invention is useful for identifying an association between susceptibility to a disease, staging of a disease, or response to a drug. The present nucleic acid sequence represents one of a collection of oligonucleotide primers (ABK85680-The human SCYB6 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polymorphic variant of small inducible cytokine subfamily B (Cys-X-Cys), Member 6 (granulocyte chemotactic protein 2) gene, useful for expressing protein isoform used in drug screening techniques

                                                                                                                                                                                                                       g
                                                                                                                                           The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/activation DC. Also described are: (1) a protein expressed by the above human maturation/activation C expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42247 represent specifically claimed human maturation/activation DC expression gene tags from the present invention.
                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the

The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42627 to ABL4296 represent specifically claimed human maturation/activation DC expression gene tags from the present invention.
highest expression among the genes expressed in human maturation/ activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the DC. ABL42627 to ABL42262 represent specifically claimed human maturation/activation DC expression gene tags from the present invention.

                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered FI, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (II); (2) a polymuclectide (III) encoding (I) or (III); and (II) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, thus designing (I) that binds to the S2 target subsite, thus designing (I) that binds to the S2 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the carpettics and plant engineering (I), (II) or (III) is useful in the subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to detecrained the phenotype and function of gene expression. (I) has improved affinity and plant engineering sequences, as well as enhanced be bological activity. ABQ71213 to ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given

The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from W-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I); (2) a polynuclectide (III) encoding (I) or (II); and (3) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that binds to the S2 target subsite, thus designing (I) that binds to the S2 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human the subject, in diagnostic methods for sequence specific detection of a subject, in diagnostic methods for sequence specific detection of the subject, in diagnostic methods for sequence specific detection of subject, in diagnostic methods for sequence specific detection of the subject, in diagnostic methods for sequence specific detection of subject, in diagnostic methods for sequence specific detection of sequences, as well as enhanced the biological activity. ABQ71213 to ABB71214 and ABB48191 to ABB51230 the second in the process and zinc finger peptides which are given in the avamant fination of the process and zinc finger peptides which are given in the second second for sequence and zinc finger and specific detection of grant function of the process and zinc finger peptides which are given and the process and zinc finger peptides which are given and specific detection of the process and zinc finger peptides which are given and specific detection of the process and zinc finger and specific detection of the process and zinc finger and specific detection d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein related oligonucleotide target SEQ ID NO:1275.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zinc finger protein; ZFP; DNA binding protein; zinc finger; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered FI). F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polymucleotide (III) encoding (I) or (II); and (S) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsider and when the province of the continual of the starget subsite and when the province of the continual of the starget subsite and when the province of the continual of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       subsite. (1) is useful in studying gene function, and for human therapeutics and plant engineering. (1), (11) or (111) is useful in therapeutic methods to medulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (1) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. ABQ71213 to ABQ71214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for sequencing an unknown DNA molecule which comprises selecting a library primer from an octamer obligonucleotide library consisting of 48 s-bs sequences and corresponding complementary sequences, where the library primer is complementary to a known sequence adjacent to the unknown sequence or is complementary to a sequence in a known extension product. The method is useful for DNA nucleotide sequencing, in PCR, and in other processes which make use of primers. The octamers are used to identify coding sequences. Primer walking using the octamer libraries is advantageous over other sequencing methods because it does not require multiple cloning steps nor subsequent template preparations, and it is a directed and methodical approach. AAA80688-A81253 represent the octamer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequencing an unknown DNA molecule for the polymerase chain reaction and other primer processes comprises primer walking of octamer oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel genetic variants of human tumour necrosis factor (INF) alpha genes. The polymorphic variants are useful in studying the expression and function of TNF, in expressing TNF proteil for use in screening for candidate drugs to treat diseases related to TNP activity. The pharmaceutical compositions comprising TNF polymucleotide, an antisease oligonucleotide directed against one of the novel TNF isogenes, a polymucleotide directed against one of the novel TNF another compound that inhibits expression of the TNF isogene are useful for treating disorders affected by expression of the TNF isogene e.g. cancer, diabetes or inflammatory disorders. Sequences of the invention are also used in gene therapy. The present DNA sequence is a primer used to detect human TNF alpha gene polymorphisms.
                                                                                                                                                                                                                                                  Human; tumour necrosis factor; TNF alpha; cancer; inflammatory disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genetic variants comprising human Tumor Necrosis Factor alpha (TNF) isogene, useful for studying the expression and function of TNF and in screening for drugs to treat cancer, diabetes or inflammatory disorders

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (3) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a cycle captession varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate which modifies the captession comprising contacting human DNA with a probe which comprises contiguous nucleotides of a NORF gene whose expression varies at lace of the yeast gene is a candidate drug as a captession of a noting nucleotides of a NORF gene whose expression varies contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a candidate drug and monitoring expression in the yeast cell of at least candidate drug and monitoring expression in the yeast cell of at least candidate drug and monitoring expression in the yeast cell of at least condidate drug and monitoring expression in the yeast cell of the cell cycle, the cilcycle and for identification of antifungal drugs.

Che differentially expressed genes may be used as markers of phases of the cell cycle and for identification of antifungal drugs.

AMF33268 to AAF44064 represent sAGE tags used in the exemplification of the present invention. AAF33267 represent linkeds and PCR considered in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               October 2, 2003 14:58 Type:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 10 BP; 2 A; 2 C; 3 G; 3 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate artifungal drugs comprising: (a) contacting a test substance with a cypeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle expression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell of at least 1 condidate drug and monitoring expression in the yeast cell of at least 1 condidate may be used to entire monitor and affect the pass of drugs. The NORF conce may be used to entire monitor and affect that and a peak of a class of drugs and monitoring expression in the yeast cell of at least 1 condidate may be used to entire monitor and affect that and a peak of a class of a condidate of a class of a con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33267 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes coding sequence of a yeast gene selected from the control of the comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contracting a test substance with a cypression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies at least 10 contiguous nucleotides of a NORF gene whose expression varies at least 10 contiguous nucleotides of a north of a class of drugs having a characteristic effect on gene comprised to a class of drugs having a characteristic effect on gene expression in a yeast cell with a

candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAR33268 to AAR44064 represent SAGE tags used in the exemplification of the present invention. AAR33262 to AAR33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (MI) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a

```

```
expression varies as in MJ, where a test substance which modifies the expression varies as in MJ, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in MJ; and (4) a method (M4) for identifying a candidate drug as a capression in a yeast cell comprising contacting a yeast cell with a captression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell of at least NORF gene whose expression is affected by the class of drugs. The NORF condidate drug and monitoring expression in the yeast cell of at least confidence in such contact and affect phases of the cell cycle, confidentification of antifungal drugs.

Condidate cell cycle and for identification of antifungal drugs.

Control sequence or a yeast gene selected from a group or 43 work (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose cypression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle cycle contiguous nucleotides of a NORF gene whose expression varies at least 10 contiguous nucleotides of a NORF gene whose expression in a yeast cell of at least 10 condidate drugs having a characteristic effect on gene expression in a yeast cell omprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 10 NORF gene whose expression is affected by the class of drugs which candidate drug and monitoring expression in the yeast cell of at least 10 Contiguous and provided the cell cycle. The methods may be used to identify candidate drugs which the cell cycle. The methods may be used to identify candidate drugs which the present invention. AAP33262 to AAP33264 frepressent linkers and PCR the primers used in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
present invention describes an isolated DNA molecule comprising a ng sequence of a yeast gene selected from a group of 745 NORF (not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; FCR primer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a cyeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate which modifies the expression varies as in M1, where a test substance which modifies the cypression comprising contacting human DNA with a probe which comprises to progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 10 NORF gene whose expression is affected by the class of drugs. The NORF contacting a markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. C the differentially expressed genes may be used as markers of phases of the cell cycle and for identification of antifungal drugs. C the primers used in the SAGE method, in the exemplification of the present invention. AAPF33262 to AAF$3267 represent linkers and principle or the resent linkers and principle or the resent linkers or the drugs which invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                  Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification;

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention.
Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ŏ
                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a cycast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression varies as in M1, where a test substance which modifies the cypression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene member of a class of drugs having a characteristic effect on gene candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 10 NORF gene whose expression is affected by the class of drugs. The NORF comparison is affected by the class of drugs which candidate drug and monitoring expression in the yeast cell of at least 10 candidate and for identifying a candidate drugs which cafferentially expressed genes may be used to identify candidate drugs which the cell cycle. The methods may be used to identify and drugs. CAAF33268 to AAF43268 to identification of antifungal drugs.

CHAF33268 to AAF43664 represent SAGE method, in the exemplification of the present invention. AAF33267 to present linkers and PCR invention.

The sequences given in AAQ65549-60 are spacer elements used within the insertion elements of the invention. These insertion elements contain junk DNA, two spacer elements, a functional DNA sequence and a primer binding site. They also contain an MluI site, an MluI site, an MluI site ire and a NheI site. The junk DNA serves to keep the MluI site from being at the extreme end of the molecule and also allows determination that the MluI cleavage has occured because the extended DNA will be reduced in size by the length of the junk sequence and the junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear use thosen randomly and the functional nucleotides sequence is chosen to achieve the binding site can be synthesised. However, the primer binding site can be synthesised. However, the primer and primer binding site are chosen such that the primer itself does not brind to any other portion of the insertion element under construction. Consertion sequences such as these can be used to insert a functional molecule into a host molecule to form a recombinant molecule. The spacer elements are thought to relieve structural stresses imposed on the host by addition of the functional nucleotide sequence. The host by addition of the functional nucleotide sequence. The host by addition of the functional nucleotide sequence. The host be used with nucleic acid hybridisation assays. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cells other transcripts correspond to novel genes. Antigen-presenting cells. (APC) associated costimulatory factors play an important role in the activation of the cytocoxic immune response that can cells. Tumour antigen presentation via the MMC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytocoxic T-lymphocytes (CTLS). Nucleic activation of cytotoxic T-lymphocytes (CTLS). Nucleic active may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hyporidisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 80; 130pp; English.

vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells.

Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cell (APC) assocified costimulatory factors play an important role in the cativation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MMC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can complex) and subsequent recognition by T-cell receptors is alone insufficient activation of cytotoxic r-lymphocytes (CTLs). Nucleic acid for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid gainst a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes. Or of their encoded proteins, can be used in vaccines to induce an immune response, particularly expressed genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate the dendritic cell differentially expressed genes, or of their encoded proteins, cells containing them are used in gene therapy. Co-administration of vectors containing them are used in gene therapy. Co-administration of vectors containing them are used in gene therapy. Co-administration of vectors containing them are used in gene therapy. Co-administration of co-stimulatory signals, migration of chemokines for the presentation of co-stimulators and secretion of co-stimulators and secretion of co-stimulators and secretion of cells containing them are us

Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell chery factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). sequences identified using the SAGE tags have several potential uses.
They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and the production of a population of antigen-specific effector cells) and cumour antigens and APC associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of or estimulatory signals, migration to T cell-rich sites, secretion of I cell growth factors and secretion of chemokines for recruitment of immune effector cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -

                                                                                                                                                 reactions. Compounds that mindlate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides or as to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for
                                   AA280767 to AA283941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoasays or hybridisation/amplification
                                                                                                                                                                                                                                                                                                                                                                                                           ;

transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts. The transcripts that are upregulated in metastatic breast transcripts.

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour fissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoasays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or eacli in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expend and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for adoptive immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                               transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts tumour tissue (i.e. are upregulated in metastatic breast transcripts.

AAX83942 to AAX86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells).

Decast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridiation/amplification reactions. Compounds that modulate expression of the transcripts are promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense cell types, of e.g. therapeutic genes (also ribozymes or antisense cell types, of e.g. therapeutic genes (also ribozymes or antisense cell) particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising therapeutic agents. Host cells that produce the polypeptides on as therapeutic agents. Host cells that produce the polypeptides on as therapeutic agents. Host cells that produce the polypeptides can be used to effecte cells, e.g. cytotoxic I lymphocytes, and these used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó

transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts.

AA283942 to AA286677 represent tags corresponding to distinct transcripts.

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour calls).

Collish. These transcripts can be used for diagnosis, prognosis, and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell. types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell.based vaccines, for diagnosing breast cancer and for raising useful in vaccines; for diagnosing breast cancer and for raising therapeutic agents. Host cells that produce the polypeptides on as therapeutic capents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; metastatic breast tumour tissue; breast cancer; tag; primer;

                                                                                                                                                                                                                                                                                                                                          AA280767 to AA283941 represent tags corresponding to distinct
transcripts that are preferentially transcribed in the metastatic breast
tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts
that are preferentially transcribed in the primary or non-metastatic
transcripts can be used for diagnosis, prognosis,
monitoring and treatment of breast cancer, particularly where metastatic.
Diagnosis is by standard immunoassays or hybridiation/amplification
reactions. Compounds that modulate expression of the transcripts are
promoters from the transcripts are used to direct expression, in selected
cell types, of e.g. therapeutic genes (also ribozymes or antisense
cell types, of e.g. therapeutic genes (also ribozymes or antisense
cell-based vaccines; for diagnosing breast cancer and for raising
specific antibodies (Ab). Ab are used to detect the polypeptides or as
therapeutic agents. Host cells that produce the polypeptides can be used
to expand and isolate populations of educated, antigen-specific immune

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation, and principle and present the contraction of the contraction 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast trumour tissue (i.e. are upregulated in metastatic breast tumour cells). A288342 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines. For diagnosing breast cancer and for raising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nseq

transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to discret expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -

AA280767 to AA283941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis,
cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be use to expand and isolate populations of educated, antiger specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -

transcripts that are preferentially transcribed in the metastatic breast
transcripts that are preferentially transcribed in the metastatic breast
twoour tissue (i.e. are upregulated in metastatic breast transcripts
that are preferentially transcribed in the primary or non-metastatic
breast tumour tissue (i.e. are downregulated in metastatic breast tumour
cells). These transcribts can be used for diagnosis, prognosis,
monitoring and treatment of breast cancer, particularly where metastatic.
Diagnosis is by standard immunoassays or hybridisation/amplification
reactions. Compounds that modulate expression of the transcripts are
potentially useful for treatment of (metastatic) breast cancer, while
promoters from the transcripts are used to direct expression, in selected
cell types, of e.g. therapeutic genes (also ribozymes or antisense
sequences), particularly an antigen-encoding sequence for use in gene or

monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for

transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in metastatic breast tumour calls).

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cast tumour tissue (i.e. are downregulated in metastatic breast tumour cast tumour tissue of breast cancer, particularly where metastatic biagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected call types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising encodines, the publication is need to direct expression, in selected call-based vaccines, for diagnosing breast cancer and for raising encodines, and the pression of the transcripts are also ensed to antition of pressing encodines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nseq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      specific antibodies (Ab). As are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be use to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for adoptive immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer; ss; human; RRAS; Ras; oncogene; SNP; single nucleotide; polymorphism; viral oncogene; GTPase; cell growth; antisense; drug development; cancer; allele specific oligonucleotide; ASO;

                                                                                                                                                                                                                                                                                                                                                                           셤
                        This invention relates to genetic variants of the human related RAS
viral oncogene RRAS. Ras proteins are a member of a superfamily of small
GTPasses that are involved in the regulation of cell growth. The
invention also comprises a related RAS viral (r-ras) oncogene homologue
invention also comprising one or more of the polymorphisms shown.

(RRAS) isogene comprising one or more of the polymorphisms shown.

RRAS or to treat disorders such as cancer using antisense therapy.

The sequences of the invention is useful for providing
haplotype information of an individual. Furthermore, the polymorphic
sequence is useful for studying the biological function of RRAS as well
as identifying drugs targeting the protein for the treatment of
disorders related to its abnormal expression or function. In particular
for validating whether RRAS is a suitable target for drugs to treat
cancer, screening for such drugs and reducing bias in clinical trials.

The present sequence represents an allele specific oligonucleotide
primer #15 used to detect the human related RAS viral oncogene (RRAS)

Primer #15 used to detect the human related RAS viral oncogene (RRAS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A new nucleic acid library of myc-dependent downstream genes capable of supporting a neoplastic characteristic of cancer is useful to find new therapies and diagnoses for cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Myc-dependent downstream gene; neoplastic; cancer; growth; invasion; spread; myc target; myc tag; SAGE; serial analysis of gene expression; myc oncogene; N-myc; human neuroblastoma; cytostatic; ds.

The present invention relates to a nucleic acid library comprising myc-dependent downstream genes or their functional fragments essentially capable of supporting a neoplastic character of cancer such as growth, invasion or spread. These myc target or tag sequences are identified by SAGE (serial analysis of gene expression). The library is useful to find new diagnoses and treatments for cancer. The invention is also useful to enhance production of recombinant proteins in a production system with high expression of endogenous or transfected myc oncogenes. ABK23412-ABK23828 represent transcript tag DNA sequences that are activated or repressed by N-myc in human neuroblastoma.
                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a nucleic acid library comprising myc-dependent downstream genes or their functional fragments essentially capable of supporting a neoplastic character of cancer such as growth, invasion or spread. These myc target or tag sequences are identified by SAGE (serial analysis of gene expression). The library is useful to find new diagnoses and treatments for cancer. The invention is also useful to enhance production of recombinant proteins in a production system with high expression of endogenous or transfected myc oncogenes. ABK23412-ABK23828 represent transcript tag DNA sequences that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A new nucleic acid library of myc-dependent downstream genes capable of supporting a neoplastic characteristic of cancer is useful to find new therapies and diagnoses for cancer

Primer-extension oligonucleotide #9 to detect human ADORA3 polymorphisms.
                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human adenosine A3 receptor (ADORA3) gene located on chromosome 1p21-p13, and methods for haplotyping and/or genotyping the ADORA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the ADORA3 gene polymorphisms. The polymucleotides for detecting the ADORA3 gene for the treatment of diseases associated with ADORA3 activity, such as pathophysiological conditions of the heart e.g. myocardial ischaemia and chronic heart failure. ABK92629-ABK92654 represent primer-extension oligonucleotides for detecting human ADORA3 gene polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          related to failure -

The invention federes to a polynuciectude compitising a filts, nucleotide sequence (NSI) comprising a PLAU (plasminogen activator, urokinase, a serine protease) isogene selected from isogene activator, urokinase, a serine protease) isogene selected from isogenes 1-9 and 11-20 given to the protease isogene comprises the regions of the PLAU gene or converse the regions of the PLAU gene polymorphisms, SNR). Also included are methods of haplotyping/genotyping (and predicting the haplotype/genotype of the PLAU gene of an individual, identifying an association between a trait and at least one haplotype or haplotype pair of the PLAU gene, a recombinant non-human organism configuration between a trait and at least one haplotype or haplotype pair of the PLAU gene, a recombinant non-human organism cransformed or transfected with the gene or CDNA, fragments of the polynucleotides of at least 10 base pairs encompassing a polymorphic colynaciblic variant PLAU gene or CDNA, a computer system for isolated monoclonal antibody specific for PLAU, a computer system for storing and analysing polymorphic variant PLAU gene and a genome contained plan that the PLAU gene. PLAU is useful in screening for drugs attached monoclonal antibody specific for PLAU, a computer system for cargeting PLAU that are useful for improving the efficiency and cancers. The methods are useful for improving the efficiency and disease associated with PLAU activity, in validating PLAU as a drug cancers. The methods are useful for improving the activity, the antibody is condition of disease associated with PLAU activity, the antibody is useful in diagnostic, prognostic and therapeutic methods. PLAU entition of polynucleotides are useful in studying the expression and function of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded DNA molecules, double-stranded DNA molecules and mRNA molecules. The present DNA sequence represents a random amplified polymorphic DNA (RAPD)
                                                                                                                                                                                                                                                                                                                                                ö
         PLAU, and in expressing PLAU protein for use in screening for candidate drugs to treat diseases related to PLAU activity. The gene for PLAU is located on chromosome 10924-qter. The present sequence is the 3' terminus of an allele specific primer used to amplify PLAU polymucleotides with a specific polymorphism using the technique of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amplification of nucleotide sequences from polynucleotides by chain extension of oligonucleotide primers, comprises 2 oligonucleotides in solution, 2 attached to supports and both share complementary sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA analysis; ss;

```
This sequence represents the recognition site contained within the delta-globin promoter for the delta-EKLF (erythroid Krueppel-like factor) polypeptide (II) of the invention. DNA encoding (II) is used in gene therapy to induce delta-globin gene expression, particularly in haematopoietic cells, specifically for treating sickle cell anaemia and haematopoietic cells, specifically for treating sickle cell anaemia and beta-thabassemia. Increased expression of delta-globin increases production of the HbA2 form of haemoglobin which has anti-sickling activity. The DNA encoding (II) is introduced into cells in vivo or in measuring levels of (II) expression in treated patients. Since (II) is a transcription factor, lower quantities of it are required compared with other sorts of therapeutic gene products.
                                                                                                                                                                                                                                                                                            Delta-globin promoter; delta-EKLF; erythroid Krueppel-like factor;
